

## Lab 06 - Deploy Online Boutique

The Online Boutique application is a set of microservices that make up an online shopping website. There is a UI application that reaches out to many APIs to retrieve its data to populate the UI. This workshop will incrementally add features to this website in the coming labs.

- Create the Online Boutique namespaces

```
kubectl apply --context cluster-1 -f data/namespaces.yaml
```

- Deploy online boutique into cluster-1

```
helm upgrade -i online-boutique --version "5.0.3" oci://us-central1-docker.pkg.dev/field-engineering-us/helm-charts/onlineboutique \
  --namespace online-boutique \
  --kube-context cluster-1 \
  -f data/values.yaml
```

- Verify pods are running

```
kubectl get pods -n online-boutique --context cluster-1
```
